Breast Cancer in Virginia

Risk Factors[1]

- Various genetic, reproductive, and lifestyle factors are associated with breast cancer risk. Factors that increase the risk of developing breast cancer include female sex, aging, family history, certain genetic mutations (e.g. BRCA1 and BRCA2 genes), dense breast tissue, certain benign breast conditions, early age at menarche, late age at menopause, never having children, age at birth of first child of 30 or older, recent oral contraceptive use, postmenopausal hormone use, overweight/obesity, sedentary lifestyle, and alcohol use.
- Steps that women can take to decrease their risk of developing breast cancer include being physically active, maintaining a healthy weight, limiting alcohol consumption, and breastfeeding.

Warning Signs and Symptoms[1]

- Abnormal finding on a mammogram
- Breast lump
- Other breast changes such as skin irritation, retraction, or discharge

Early Detection[1]

- Screening mammography (x-ray of the breast) according to guidelines
- Magnetic resonance imaging (MRI) is also recommended for some high-risk women

Breast Cancer Facts

- Breast cancer is the most commonly diagnosed cancer (excluding non-melanoma skin cancer) and the second leading cause of cancer death (after lung cancer) among women in the United States. One in eight women will be diagnosed with breast cancer during her lifetime.[1]
- Over the 2005-2009 time period, the incidence rate of breast cancer was 124.0 cases per 100,000 women in Virginia.[2] (U.S. rate=124.3 cases per 100,000 women)[3]
- Figure 1 shows breast cancer incidence rates by health district in Virginia. Chesterfield, Portsmouth, and Hampton had the highest incidence rates of breast cancer among the 35 health districts.[2]

Figure 1

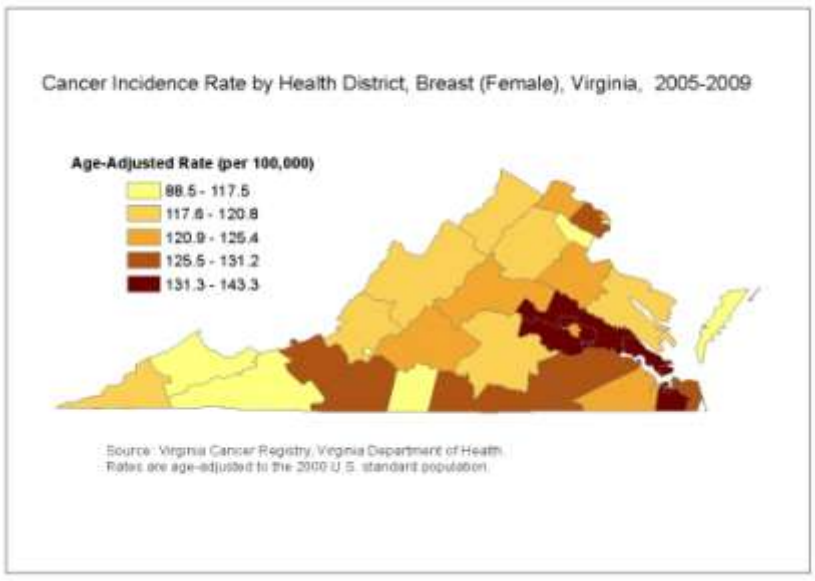

Figure 2

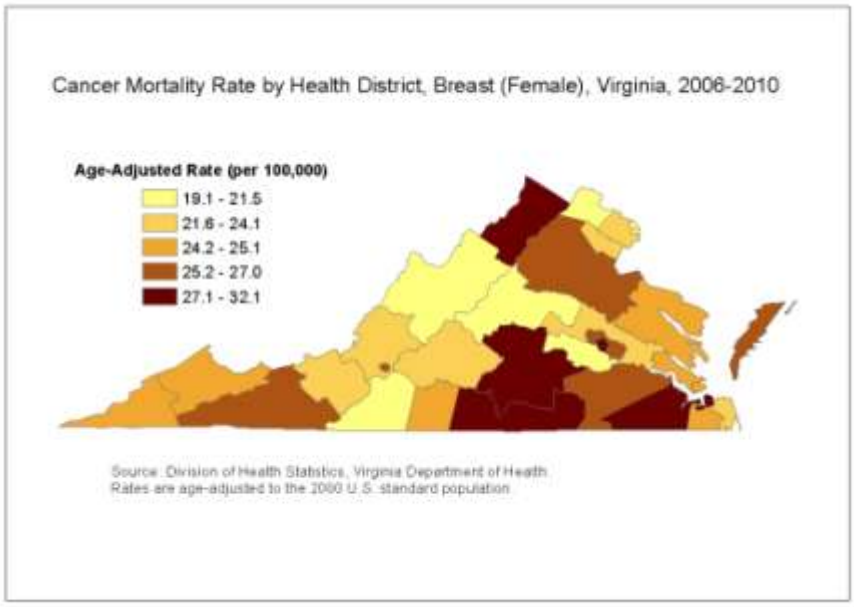
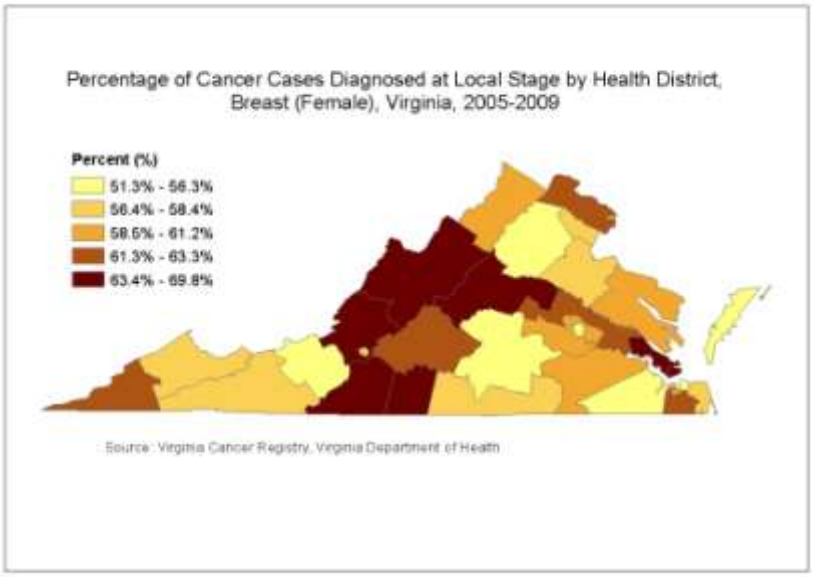


- Over the 2006-2010 time period, the mortality rate from breast cancer was 23.9 deaths per 100,000 women in Virginia.[4] (U.S. rate=22.5 deaths per 100,000 women)[5]
- Figure 2 shows breast cancer mortality rates by health district in Virginia. Western Tidewater, Portsmouth, and Piedmont had the highest mortality rates from breast cancer among the 35 health districts.[4]

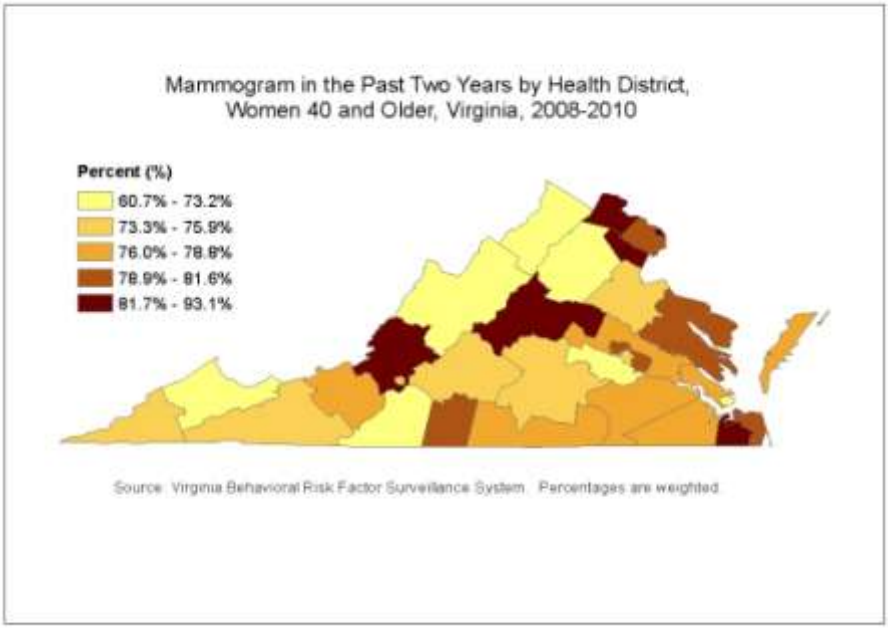
- African-American women and white women in Virginia were diagnosed with breast cancer at rates of 126.1 per 100,000 and 124.2 per 100,000, respectively.[2] African-American women had a mortality rate that was 48% higher than that of white women.[4]
- Breast cancer has a five-year relative survival rate of 98 percent if diagnosed in its earliest (local) stage when it is most curable.[1] In Virginia, 61 percent of breast cancer diagnosed was local stage.[2]
- Figure 3 shows the percentage of breast cancer cases diagnosed local stage by health district in Virginia. New River, Western Tidewater, and Eastern Shore had the lowest percentage of breast cancer cases diagnosed local stage among the 35 health districts.[2]
- White women (63%) were more likely to have their breast cancer diagnosed local stage than African-American women (53%).[2]
- According to 2010 health behavior survey data, 78% of Virginia women 40 years and older reported having had a mammogram in the previous two years. (U.S. average=75%)[6]

Figure 3



- Figure 4 shows mammography screening rates by health district in Virginia. Cumberland Plateau, Rappahannock/ Rapidan, and West Piedmont had the lowest mammography screening rates among the 35 health districts.[7]
- Mammography screening rates were lower among women who were less educated, lower income, and uninsured. The prevalence of mammography screening was 81% among African-American women and 78% among white women.[7]

Figure 4



- In Virginia in 2010, there were 1,712 inpatient hospitalizations for female breast cancer, at a total cost of over $59 million. The average length of stay was 2.3 days and the average charge per stay was $34,479.[8]
